Parking lot USB exercise - Rayane Merlin

Contents	Write **2-3 sentences** about the types of information found on this device. ● *Are there files that can contain PII?* ● *Are there sensitive work files?* ● *Is it safe to store personal files with work files?* The USB drive contains some personal and work files for example a resume, a new hire letter and a shift schedule. Several files contain PII data, such as names, addresses, and employment history.
Attacker mindset	Write **2-3 sentences** about how this information could be used against Jorge or the hospital. ● *Could the information be used against other employees?* ● *Could the information be used against relatives?* ● *Could the information provide access to the business?* An attacker could use the resume and the photos to craft phishing or social engineering messages against Jorge. The shift schedule document and the new hire letter could reveal some employees' names, enabling impersonation or targeting of other employees.
Risk analysis	Write **3 or 4 sentences** describing technical, operational, or managerial controls that could mitigate these types of attacks: ● *What types of malicious software could be hidden on these devices? What could have happened if the device were infected and discovered by another employee?* ● *What sensitive information could a threat actor find on a device like this?* ● *How might that information be used against an individual or an organization?* USB baiting is a common technique that can hide malware such as ransomware, keyloggers, or remote access trojans. A method could be scanning devices in a sandbox and overall never plug in found drives. The hospital should require regular security awareness and a policy separating personal and work devices (and potentially conduct audits).
