Cybersecurity Incident Report: Network Traffic Analysis

Rayane Merlin

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.
The UDP protocol reveals that the DNS was sent but not delivered. This is based on the results of the network analysis, which show that the ICMP echo reply returned the error message udp port 53 unreachable The port noted in the error message is used for DNS The most likely issue is the DNS server doesn't listen on port 53, or its DNS service is unavailable

Part 2: Explain your analysis of the data and provide at least one cause of the incident.
Time incident occurred : 13:24:32 (1:24 p.m.) Explain how the IT team became aware of the incident : Users reported that they couldn't access the website Explain the actions taken by the IT department to investigate the incident: Analyzing network logs and examining UDP and ICMP packets to identify the cause of the DNS failure. Note key findings of the IT department's investigation (i.e., details related to the port affected, DNS server, etc.) : DNS requests to server 203.0.113.2 failed because UDP port 53 was unreachable. The same error occurred three times. Note a likely cause of the incident :

The DNS service was unavailable on port 53, maybe due to a misconfiguration or service failure.
