Security incident report - Rayane Merlin

Section 1: Identify the network protocol involved in the incident
Four domains are involved in this incident : - DNS : Gives to the client the ip correspond to a domain name - TCP : Establish the connection between two devices (here, client to server and vice versa) - HTTP : Enables browser to ask and load a webpage - IP : Routes the packet between the devices

Section 2: Document the incident
The attacker used bruteforce attack to compromise yummyrecipesforme.com, gaining access to the Admin account, because of a lack of controls and security and an existing default password. The attacker after that modified the content of the page, by a redirection to a fraudulent website greatrecipesforme.com containing malware disguised as a browser update. The TCPDump confirms this by resolving both domain names (DNS) and HTTP requests to the corrupted website.

Section 3: Recommend one remediation for brute force attacks
To prevent similar incidents, it could be interesting to replace the default passwords with a strong and unique one. Also, implement account lockout or rate limiting to prevent brute-force attacks coupled to a mandatory multifactor authentication (MFA) for administrator accounts.
